

Install & Use the Paraloom Plugin

Claude Desktop · about 5 minutes · no terminal needed

Before you start: you need **Claude Desktop** on a paid plan (Pro, Max, Team, or Enterprise) and a **Paraloom login**. Download the plugin file `paraloom-plugin.zip` from github.com/metrifi/paraloom-plugin (in the `dist` folder) and save it where you can find it.

INSTALL IN 7 STEPS

- 1 Open Claude Desktop and go to `Settings`**
Click your name or the gear icon to open Settings.
- 2 Open the `Plugins` section**
- 3 `Add` → `Upload plugin`**
Click Add, then choose "Upload plugin."
- 4 Drop in `paraloom-plugin.zip` and click `Upload`**
Select the zip you downloaded. It installs as "ready to use."
- 5 Open the `Connectors` tab and click `Install` next to **Paraloom****
This adds the Paraloom connector. The button then changes to **Connect**.
- 6 Click `Connect`**
The Paraloom sign-in window opens.
- 7 Log in to Paraloom**
After you sign in, Claude Desktop shows **Connected**. You only do this once.

You're connected. Start a new chat and try one of the prompts on the next page. If a chat you already had open doesn't see the plugin, fully quit Claude (Cmd-Q) and reopen it.

Using the plugin

The plugin runs the Paraloom experiment workflow. Just type one of these in a normal chat and swap in your own details. It handles the phases and pauses at the points that need a human.

KICK OFF AN EXPERIMENT

Run an experiment for [credit union] on [topic].

Example: *"Run an experiment for Listerhill Credit Union on first-time homebuyer mortgages."* It researches real search demand, designs the experiment, drafts the article, and runs the compliance/fact/accessibility reviews — then prepares the client deliverable and stops for the FI sign-off.

SEND IT TO THE CUSTOMER

Send the [experiment] deliverable to the client.

It builds and publishes the deliverable and drafts the client email — then **waits for your OK** before anything is actually sent.

CHECK FOR REVISIONS

Check [experiment] for client responses and apply any revisions.

It pulls the client's answers and checklist confirmations, applies them the right way, re-runs the reviews, and pushes an updated version. If nothing new came in, it says so and stops.
